## PROBLEM UNDERSTANDING & PROPOSED IDEA

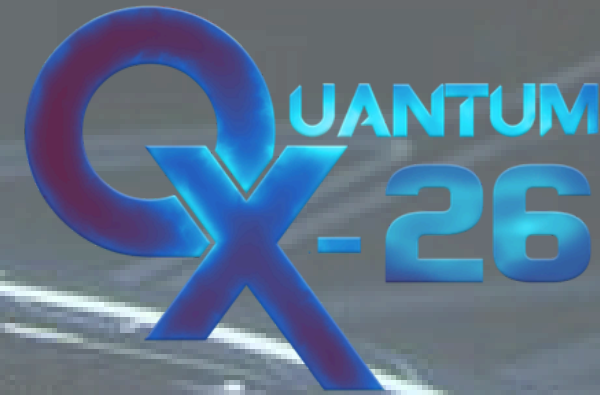

- Hospitals often rely on manual communication between patient rooms and pharmacy which causes delays and inconsistencies. This becomes an even bigger problem during an emergency when time response is critical
- Architecture of hospital is preloaded so number of rooms and location of pharmacy is pre programmed
- Designing a robot which can accurately keep track of all medicine requests across all rooms and then report to the pharmacy station after collecting requests
- in case of an emergency, a specific room can request priority and get the medicines from the pharmacy to the room with highest priority
- highly reliable system, visual cues for faster communication between rooms and pharmacy,

## SYSTEM ARCHITECTURE/ WORKING

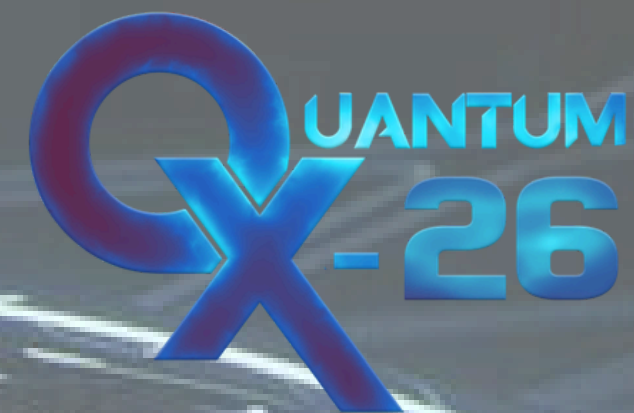

- Block diagram
- Step-by-step working:
  1. robot detects a room
  2. How robot navigates
  3. How data is processed
  4. How output is given

## CIRCUIT DIAGRAM

## INNOVATION, FEASIBILITY & OUTPUT

- obstacle detection, emergency supply runs, priority communication during emergency
- cheaper, low margin for errors
- reliable delivery of medicines
- Goes to each room, checks if a request is made or not, logs each request, goes to pharmacy and reports each request from each room, gives priority reporting during and emergency from room to pharmacy
- the robot will log the requests and keep count using a tft display for easier reference(input using a switch),will then display all requests using a combination of buzzers, led lights and the display
